Research Methods for Political Science

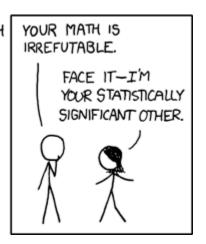

Bivariate statistics: cross tables and chi-square

Dr. Thomas Chadefaux

Assistant Professor in Political Science
Thomas.chadefaux@tcd.ie

Bivariate statistics

Bivariate: relationship between two variables

- Today: relationship between two nominal or ordinal variables
 - Cross tables
 - Chi-square

Cross table

Table: Turnout and home ownership

	Owner without a mortgage or loan	Owner with a mortgage or loan	Local authority tenant	Private tenant Other	
I voted in the election	91.1%	89.5%	80.0%	69.2%	81.2%
I did not vote in election	6.1%	7.3%	10.0%	22.0%	17.2%
I thought about voting but didn't	0.0%	1.0%	4.3%	3.3%	1.6%
I usually vote but didn't	2.9%	2.2%	5.7%	5.5%	0.0%

Rules for a crosstable

- Keep ordering for ordinal variables
- Independent variables in the columns
- Dependent variables in the rows
- Calculate column percentages
- Compare percentages across the rows

Table: Turnout and home ownership

	Owner without a mortgage or loan		Owner with a mortgage or loan	Local authority tenant	Private tenant	: Other
I voted in the election	91.1%	,	89.5%	80.0%	69.2%	81.2%
I did not vote in election	6.1%		7.3%	10.0%	22.0%	17.2%
I thought about voting but didn't	0.0%	%	1.0%	4.3%	3.3%	1.6%
I usually vote but didn't	2.9%		2.2%	5.7%	5.5%	0.0%

Table: Household income and how closely respondent followed election campaign

			Hou	sehold inc	ome	
		UNDER 240 P/W	241-450 P/W	451-700 P/W	701-999 P/W	1,000 OR MORE P/W
	VERY CLOSELY	21.5%	21.4%	19.8%	26.6%	36.3%
How closely	FAIRLY CLOSELY	40.5%	42.8%	46.3%	48.8%	43.8%
did you follow the election campagin	NOT VERY CLOSELY	23.1%	28.4%	27.6%	18.7%	16.7%
campagm	NOT CLOSELY AT ALL	14.9%	7.4%	6.3%	6.0%	3.2%

Table: Colonial past and state stability

		Col	Colony of what country? (from CIA World Factbook)						
		Not a colony	UK	France	Portu- gal	Spain	Soviet Union	Other col.	
Stab- ility	Fragile	20.0	30.2	35.7	25.0	33.3	30.8	33.3	30.5
ility	Intermediate	10.0	33.3	60.7	12.5	47.6	42.3	25.0	35.8
	Stable	70.0	36.5	3.6	62.5	19.0	26.9	41.7	33.7
Total		100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Note: Figures represent percentages per country.

Measures of association

Generally these measure the strength of the relationship between two variables

- Which one to use depends on the measurement level
 - Categorical or ordinal -> chi-square based
 - Continuous (interval-ratio) -> correlation§

Home ownership and voting

			Owner or	tenant	Total
			Owner	Tenant	iotai
Vote in 2007	Diducto	Count	938	119	1057
	Did vote	%	90.5%	73.9%	88.2%
election	Did not	Count	99	42	141
	vote	%	9.5%	26.1%	11.8%
Total		Count	1037	161	1198
		%	100.0%	100.0%	100.0%

Chi squared

Difference in the sample, can we generalize this to the population?

Chi squared

• Observed frequencies (f_o)

• **Expected** frequencies (f_e) , if variables would not be related

$$\chi^2 = \sum \frac{(f_o - f_e)^2}{f_e}$$

			Owner o	or tenant	Total
			Owner	Tenant	Total
Vote in 2007	Did vote	Count	938	119	1057
election	Did not vote	Count	99	42	141
Total		Count	1037	161	1198
Total (%)			0.87%	0.13%	100%

How likely is it that we obtained these numbers by chance?

That is: if there was no relationship between ownership and voting in the population, how likely is it we get numbers which are so far away from what we would expect (or more extreme)?

			Owner o	or tenant	Total	Total (%)
			Owner	Tenant	Total	10tai (70)
Vote in 2007	Did vote	Count	Α	С	1057	88%
election	Did not vote	Count	В	D	141	12%
Total		Count	1037	161	1198	100%
Total (%)			0.87%	0.13%	100%	

• If ownership and vote were not related, how many respondents should we expect in cell A?

			Owner o	or tenant	Total	Total (%)
			Owner	Tenant	Total	Total (%)
Vote in 2007	Did vote	Count	A = 88%*0.87%	C = 88%*0.13%	1057	88%
election	Did not vote	Count	B = 12%*0.87%	D = 12%*0.13%	141	12%
Total		Count	1037	161	1198	100%
Total (%)			0.87%	0.13%	100%	

- If ownership and vote were not related, how many respondents should we expect in cell A?
 - If among all voters, 88% did vote, we would expect that among owners, also 88% would vote.
 - If among all owners, 87% did vote, we would expect that among voters, also 87% would vote.

			Owner o	or tenant	Total	Total (%)
			Owner	Tenant	Total	Total (%)
Vote in 2007	Did vote	Count	Α	С	1057	88%
election	Did not vote	Count	В	D	141	12%
Total		Count	1037	161	1198	100%
Total (%)			0.87%	0.13%	100%	

- If ownership and vote were not related, how many respondents should we expect in cell A?
- Expected frequency (f_e) = row margin* $\frac{\text{column margin}}{\text{total}}$
- $f_e = 1037 * \frac{1057}{1198}$
- $f_e = 1037 * 0.88 = 914.9$

			Owner o	or tenant	Total
			Owner	Tenant	Total
Vote in 2007	Did vote	Count	Α	С	1057
election	Did not vote	Count	В	D	141
Total		Count	1037	161	1198

Expected frequency
$$(f_e) = \frac{\text{row margin} * \text{colum margin}}{\text{total}}$$

			Owner o	or tenant	Total
			Owner	Tenant	Total
Vote in 2007	Did vote	Count	Α	С	1057
election	Did not vote	Count	В	D	141
Total		Count	1037	161	1198

• B:
$$f_e$$
 = 1037 * 141 / 1198 = 122.1

• C:
$$f_e = 1057*161/1198 = 142.1$$

• D:
$$f_e$$
 = 141 * 161 / 1198 = 18.9

			Owner o	or tenant	Total	
			Owner	Tenant		
Vote in 2007 election	Did vote	Count	914.9	142.1	1057	
	Did not vote	Count	122.1	18.9	141	
Total		Count	1037	161	1198	

		Owner or tenant			Total
			Owner	Tenant	iotai
Vote in 2007	Did vote	Count	938	119	1057
election	Did not vote	Count	99	42	141
Total		Count	1037	161	1198

			Owner or tenant		
			Owner	Tenant	Total
Vote in 2007	Did vote	Count	914.9	142.1	1057
election	Did not vote	Count	122.1	18.9	141
Total		Count	1037	161	1198

			Owner o	Total	
			Owner	Tenant	iotai
Vote in 2007	Did vote	Count	938	119	1057
election	Did not vote	Count	99	42	141
Total	7010	Count	1037	161	1198

			Owner or tenant		Total
			Owner	Tenant	iotai
Vote in 2007	Did vote	Count	914.9	142.1	1057
election	Did not vote	Count	122.1	18.9	141
Total	7010	Count	1037	161	1198

$$\chi^2 = \sum \frac{(f_o - f_e)^2}{f_e}$$

Cell A:
$$\frac{(f_o - f_e)^2}{f_e} = \frac{(938 - 914.9)^2}{914.9} = \frac{533.61}{914.9} = 0.58$$

			Owner or tenant		Total
			Owner	Tenant	IOtai
Vote in 2007	Did vote	Count	938	119	1057
election	Did not vote	Count	99	42	141
Total	1010	Count	1037	161	1198

			Owner or tenant		Total
			Owner	Tenant	iotai
Vote in 2007	Did vote	Count	914.9	142.1	1057
election	Did not vote	Count	122.1	18.9	141
Total		Count	1037	161	1198

Cell B:
$$\frac{(f_o - f_e)^2}{f_e} = \frac{(99 - 122.1)^2}{122.1} = \frac{533.61}{122.1} = 4.37$$

Cell C: $\frac{(f_o - f_e)^2}{f_e} = \frac{(119 - 142.1)^2}{142.1} = \frac{533.61}{142.1} = 3.76$

Cell D: $\frac{(f_o - f_e)^2}{f_o} = \frac{(42 - 18.9)^2}{18.9} = \frac{533.61}{18.9} = 28.23$

Chi squared

$$\chi^2 = \sum \frac{(f_o - f_e)^2}{f_e}$$

$$\chi^2 = .58 + 4.37 + 3.76 + 28.23 = 36.94$$

Interesting, but what does that mean?

Chi squared

 We need to compare the chi squared we obtained with the critical value for chi squared.

• If $\chi^2_{\text{obtained}} > \chi^2_{\text{critical}}$ we can conclude that it is unlikely that the relationship we found is just due to sampling error.

The cricical value

- First, we need to set a confidence level, normally 95%
- This corresponds to a *p* value of 0.05 (1 95/100).
- Second, we need to know the degrees of freedom: df = (c-1)(r-1)

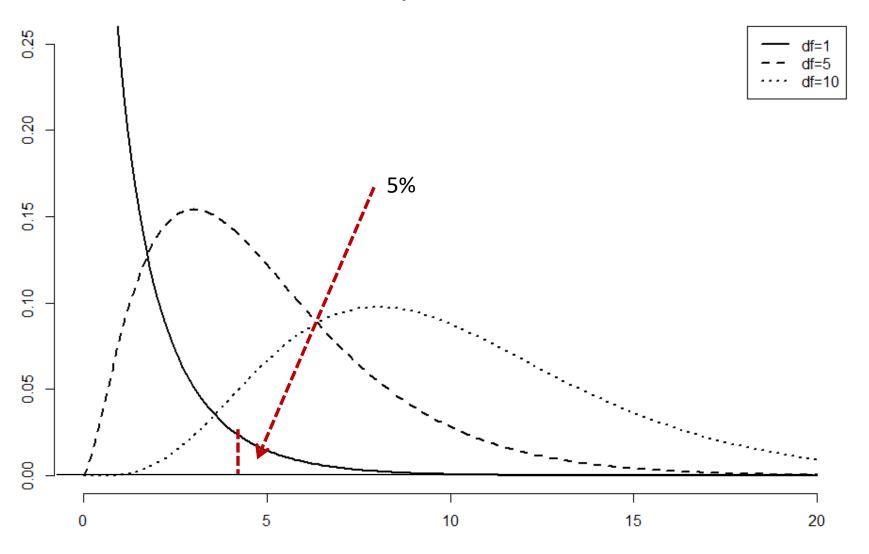

The critical value

In our example:

- The degrees of freedom:
 - 2 rows
 - 2 columns
 - -df = (2-1) * (2-1) = 1 * 1 = 1
- The critical value corresponding df = 1 and p = 0.05 is found in Field, appendix A.4:

DISCOVERING 308 A.4. Critical values of the chi-square distribution 0.05 df 0.01 0.05 37.65 25 6.63 3.84 38.89 26 2 5.99 9.21 40.11 27 7.81 11.34 41.34 28 9.49 13.28 42.56 29 5 11.07 15.09 43.77 30 6 12.59 16.81 49.80 35 14.07 18.48

Chi square distribution

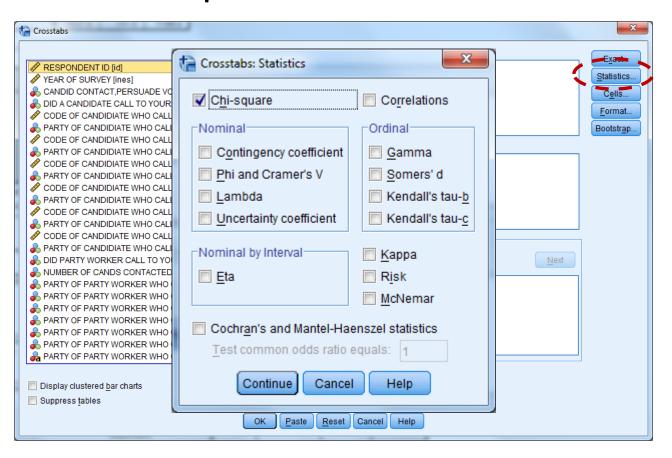

Comparing obtained and critical value

- $\chi^2_{\text{obtained}} = 36.94$
- $\chi^2_{critical} = 3.84$

• As $\chi^2_{\text{obtained}} > \chi^2_{\text{critical}}$ we conclude that there is a statistically significant relationship.

Case Processing Summary

	Cases						
	Va	lid	Miss	sing	Tot	tal	
	Ν	Percent	Ν	Percent	Ν	Percent	
Vote in 2007 election * Owner or tenant	1198	11.5%	9225	88.5%	10423	100.0%	

Vote in 2007 election * Owner or tenant Crosstabulation

% within Owner or tenant

		Owner o		
		Owner	Tenant	Total
Vote in 2007 election	Did vote	90.5%	73.9%	88.2%
	Did not vote	9.5%	26.1%	11.8%
Total		100.0%	100.0%	100.0%

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2- sided)		
Pearson Chi-Square	36.715 ^a	1	.000			
Continuity Correction	35.140	1	.000	_		
Likelihood Ratio	29.949	1	.000			
Fisher's Exact Test				.000		
Linear-by-Linear Association	36.685	1	.000			
N of Valid Cases	1198					

- a. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 1
- b. Computed only for a 2x2 table

Chi squared

- If our N increases, our Chi-squared obtained will be larger. Thus: large N, more likely to find a statistically significant relationship
- If the number of categories increases, our degrees of freedom will increase, increasing Chi-squared critical. Thus: more categories, less likely to find a statistically significant relationship.

Assumptions of Chi squared

- Independent observations: each person, country, or other observation should only contribute to one cell in the cross table
- Expected frequencies should be greater than 5 in each cell. (Otherwise the sampling distribution of the Chi squared statistic does not follow a Chi squared distribution)

Strength of association

- Chi squared does not tell you how strong a relationshp is, only whether it is statistically significant.
- If N is large, you are likely to find a significant relationship (but it might be a weak one).

 Solution: look at a measure of association, such as Cramers' V.

Cramer's V

 When your table is larger than 2x2, we should use Cramer's V (because Phi would never reach 0 in these cases):

•
$$V = \sqrt{\frac{\chi^2}{N*(\text{Minimum of } r - 1, c - 1)}}$$

• The minimum of r-1, c-1, in our case is: the minimum of 2-1 and 2-1, which is 1.

Cramers' V

If we find a Chi square of 80 for a 3 x 5 table,
 with N = 900.

•
$$V = \sqrt{\frac{\chi^2}{N*(\text{Minimum of } r - 1, c - 1)}}$$

•
$$V = \sqrt{\frac{80}{900*(\text{Minimum of } 3-1,5-1)}} = \sqrt{\frac{80}{900*2}}$$

•
$$V = 0.21$$

In SPSS

 Select Phi/Cramer's V in the 'Statistics' dialog when making a crosstable (Analyze ...
 Descriptive Statistics ... Crosstable).

	Symmetric Measures
